Education and Certifications

Western University Sept. 2022 – April 2026
Bachelor of Science in Computer Science *London, ON*

- **HTB Certified Web Exploitation Specialist (CWES)**, July 2026
- Two-time Dean's Honour List recipient

Experience

Independent Security Researcher (Bug Bounty) April 2026 – Present
Bugcrowd, HackerOne, Intigriti, Google VRP *Remote*

- **Ranked in the Top 15 researchers** on Keeper Security's Bugcrowd program through validated findings
- **Discovered a high-severity Google Cloud flaw** in the Backup and DR product that exposed private data across separate cloud projects
- **Achieved account takeover** on NASA's GLOBE platform through stored XSS; validated as High (P2)
- **Bypassed Keeper's device-approval control**, which let unapproved devices reach authentication; drove a fix within 24 hours of validation and earned **public credit in Keeper's release notes**
- **Found a SQL injection** in Keeper Gateway's password-rotation plugins that enabled **database-account takeover** of any user; validated as High (P2), fixed, and rewarded
- **Reported 30+ vulnerabilities across 4 programs**, each with CVSS 3.1 scoring and fix guidance

Kaimz Inc. Jan. 2025 – April 2025
Cybersecurity Intern *Waterloo, ON*

- **Built a Python integration** between Wazuh and the Jira REST API that auto-created tickets for high-severity alerts with their severity and a short summary, removing manual ticket entry
- **Configured Wazuh firewall rules** to block malicious IP addresses on monitored endpoints

Open Source

OWASP ZAP Jan. 2026 – June 2026
Contributor | Java, JUnit 5, Gradle *Open-Source DAST Scanner*

- **Merged 3 pull requests** adding example alerts for the LDAP injection, username enumeration, and SQLite injection scan rules to ZAP's alert documentation
- **Wrote JUnit 5 tests** for alert content and built reusable alert builders that removed duplicate code

Projects

Multi-Agent Bug Bounty Harness April 2026 – Present
Python, SQLite, TypeScript, Node.js, Multi-Model Agents

- **Built a multi-agent AI system** that reads a bug bounty program's rules, splits the work into tasks, runs agents in parallel, and tracks every test and finding in a SQLite database
- **Produced 30+ bug bounty reports** across 4 programs with this system, including Google Cloud, Keeper Security, and NASA findings
- **Cut false positives** by running each agent role on a different AI model and holding every finding until it passes two independent reviews and a clean-machine reproduction
- **Verified every finding against real network traffic**: a check sends a marked request and fails unless the proxy recorded it, and those recorded requests become the report evidence
- **Kept agents within program rules** with two layers of code that block unsafe commands and check every request against allowed hosts and paths; covered by **35 unit tests**

Technical Skills

Languages: Python, C, JavaScript, TypeScript, Bash, SQL (PostgreSQL, MySQL, SQLite)
Security: Burp Suite, Caido, OWASP ZAP, ffuf, Gobuster, Nmap, sqlmap, Wazuh
Developer Tools: Git, GitHub, Docker, Linux, Google Cloud, Jira, JUnit 5
AI Tooling: Claude Code, Codex, multi-agent workflows, multi-model agent routing
